

Final-semester Systems Engineering student with strong foundations in computer science, cloud computing, and modern software development, complemented by self-taught knowledge in economics and finance. Experienced in developing RESTful API applications, containerizing services with Docker, and automating deployments through CI/CD pipelines. Proven ability to communicate technical concepts effectively through tutoring experience, professional proficiency in English and native Spanish speaker.

EDUCATION

<u>Pontificia Universidad Javeriana</u>	July 2022 – June 2026
Bachelor of Engineering, Systems Engineering	Expected Graduation Date: September 2026 CGPA: 4.02 / 5.0
Relevant Coursework: Distributed Systems, Software Architecture, Cloud Computing, Analysis of Algorithms, Data Structures and Algorithms, Databases, Analysis and Software Design, Object-Oriented Programming, Microeconomics, Principles of Economics, Cybersecurity.	
<u>Universidad Industrial de Santander</u>	April 2022 – November 2022
Diploma of Education, Misión Tic 2022 Learning Route 2	
Relevant Coursework: Fundamentals of programming with Python, Object-Oriented Programming with Java, Introduction to web development with JavaScript, HTML and CSS.	

EXPERIENCE

<u>Pontificia Universidad Javeriana</u>	February 2024 – July 2024
Tutor for Data Structures and Algorithms	
Helped more than 25 students enrolled in the Data Structures and Algorithms class by solving their doubts and assisting them with their difficulties understanding different data structures, algorithms and their complexity using C++ as programming language.	
<u>Pontificia Universidad Javeriana</u>	February 2023 – November 2023
Tutor for Introduction to Programming	
Supported more than 60 students enrolled in the Introduction to Programming class by solving their doubts and helping them with their common problems related to learning the fundamentals and logic of programming using C++.	

EXTRACURRICULAR ACTIVITIES

<u>ACM Chapter Javeriana</u>	January 2023 – January 2025
Board member of the ACM Chapter Javeriana	
Delivered lessons about Introduction to Programming and Object-Oriented Programming (OOP) to more than 100 undergraduate students, focusing on improving their understanding of fundamental concepts prior to their tests. Additionally, from January 2024 to June 2024, I lectured the foundations of computer programming to 8 students from a public school of Bogotá using JavaScript.	

HONORS & AWARDS

<u>Andres Bello Distinction Ministry of National Education</u>	December 2022
Awarded the “Andres Bello” distinction for achieving excellent results in the “Saber 11” test in the urban and rural category in the year 2021.	
<u>Generación E, Excelencia Scholarship Ministry of National Education</u>	June 2022
Awarded the “Generacion E, Excelencia” scholarship to fund my higher education as a recognition of my academic excellence as a high school graduate in the year 2022.	

TECHNICAL SKILLS

LANGUAGES

<u>Programming Languages:</u> C++, Java, Go, Python, JavaScript/TypeScript <u>Backend:</u> Gin (Go), Spring Boot, Express.js <u>Frontend:</u> React, Angular <u>DevOps & Cloud:</u> Docker, AWS, CI/CD <u>Databases:</u> PostgreSQL, MongoDB <u>Other:</u> Git, Linux.	<u>English (C2)</u> Spanish (Native)
--	---

LICENSES & CERTIFICATIONS

<u>AWS Certified Cloud Practitioner</u>	October 2024
---	--------------

RECENT PERSONAL PROJECTS

<u>The Minecraft Server Generator</u>
Designed and developed a RESTful API application using React, Go & Gin, the AWS SDK for Go, Supabase authentication and database services (PostgreSQL), Docker to containerize the backend and fetch the <code>itzg/minecraft-server</code> Docker image from Docker Hub to the EC2 instance where the server is hosted, and a CI/CD pipeline to automate deployment (backend to Render and frontend to GitHub pages) for creating and hosting multi-player servers for Minecraft Java Edition on the AWS cloud through an easy GUI.
<u>Compound Interest Calculator with Investment Insights</u>
Implemented a RESTful API application using Go & Gin, React, the OpenAI’s API and Docker that allows users to calculate how compound interest can help them grow their savings and obtain insights to replicate their calculation using ETFs listed on US stock markets with an average return close to the target interest rate used for the calculation in the last 5 years.
<u>The Solar System</u>
Developed a RESTful API application using Node.js & Express.js, MongoDB, and React to display the information about the planets on the solar system by fetching their information from the database and feature that lets the user know how long it will take them to travel from one planet to the other at the speed of light and at the speed of the fastest rocket-spacecraft system capable of carrying humans.
